

HOW GOOD IS YOUR PROTECTION?

A terrorist dirty bomb. An industrial accident. An outbreak of a new virus. Can your building protect occupants against the effects of these airborne threats?

We provide a comprehensive assessment of your building's protection against naturally occurring and intentionally delivered biowarfare agents.

Assessments include a thorough inspection of the building by our field engineers who gather critical data on the HVAC system, floor plan, occupancy patterns and strategic security concerns.

Senior level consultants generate an Attack Scenario Report based on your building's data and advanced simulation modeling.

The Attack Scenario Report indicates likely casualties for various pathogens (e.g. anthrax, virus) and attack scenarios (e.g. outdoor or indoor release). Reports also compare casualties for a building's existing protection against upgraded protection. Included in the report are documentation of security weaknesses, suggestions for protection upgrades and an action plan to implement the changes.
